KeyMACRO is an application that enables you to encrypt and decrypt text and files, in addition to generating login credentials. Encrypt and decrypt documents, text and files KeyMACRO can encrypt and decrypt any files, text or data stored in the computer. You can choose between AES and Twofish encryption, as well as generate a unique 256-bit key for each file. Once the encryption has been completed, the original text or data can be decrypted with the key, and you can choose to store the password on your computer or on the cloud. In addition, you can also store notes about the encrypted files, as well as an optional URL. Generate login credentials When using a website, the login credentials can be stored in a secure manner, in addition to preventing someone from logging in to your account without your permission. KeyMACRO offers to generate an account password that can be stored on your computer or the cloud. You can also generate an email address that can be used for the website. This account can then be used to access the site, as well as to send password-protected emails. The encryption of the generated

password is based on a strong AES algorithm, and there is no need to include any extra characters. Minimalistic interface KeyMACRO features a minimalistic interface that is easy to use. However, it does not allow you to adjust any of the settings or specify the length of the generated password. Decrypt files when offline When you are offline, you can still decrypt files that have been encrypted with KeyMACRO. The utility also enables you to encrypt files using a key that is stored on your cloud or online backup, and this can be accessed anytime you want. Furthermore, you can also synchronize the encrypted files between devices and even between your computer and your online backup account. Plenty of file formats supported KeyMACRO supports over 60 file formats, including text, audio, video and other image files. When encrypting a file, you can also specify the amount of time to remain online before the decryption process starts. Keep your data safe from prying eyes An important aspect of this program is that it enables you to store all of your login details in a secure manner. You can encrypt all of your accounts and passwords with a single key that you can use to decode the information whenever needed. There is no need to carry around the original password anymore, and if you are worried that it might fall into the wrong hands, you can either upload the key to an external server or simply copy the data from your clipboard. Crypto_Pocket also lets you use the program as a sort of encrypted text editor. You can encrypt any document and store it locally in a file, and only the person that has the key can open it. Everything from the address bar to the clipboard can be encrypted and stored. You can even create encrypted personal notes, which can be accessed with the correct key. This unique concept allows you to store your login details in a secure manner, and create encrypted notes as well. Protect and share sensitive information Crypto_Pocket also comes with a strong feature that enables you to protect and share various files and folders. You can either encrypt a document or a file on a local system or import it from an external source. A customizable password manager that encrypts and stores your passwords in a secure manner. Store your account credentials in a secure manner Crypto_Pocket allows you to create a local database in which all your login details are stored in an encrypted form. You can enter each account's name, email address, URL, username and password, as well as provide the encryption key. Once an entry has been created, the username and password can only be viewed if the original key is available. You can also search for specific items based on their description, associated email or URL, but the entries cannot be sorted. Encrypt and decrypt text or files When you wish to encrypt a document or message, you can either write the text manually or import a local TXT file. The encoded content is saved in the same folder and can only be decrypted with the correct key. Things are more or less the same when encrypting files, and there do not seem to be any format restrictions.
